

## The Rise of Electric Vehicles 2

### Transcript:

The transport sector is among the largest contributors to EU greenhouse gas emissions. Therefore, reducing transport emissions is vital to meeting the EU's climate neutrality objectives. From 2025 onwards, regulation EU 2019/631 sets stricter EU-wide CO<sub>2</sub> fleet targets. A 15% reduction by 2025 for both cars and vans. And from 2030 a 50% reduction target for vans and a 55% reduction target for cars all relative to a 2021 baseline. It also sets a zero CO<sub>2</sub> emission target for new cars and vans from 2035 onwards. A significant increase in the uptake of electric vehicles will be needed to achieve these goals.
